Varus alignment

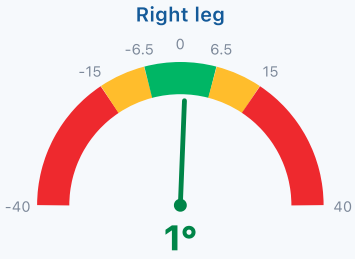

Knee extension ability

Annotated posture image unavailable

Normal knee extension

Annotated posture image unavailable

Normal knee extension

Overall evaluation

Low risk (score: 0-23). No clear OA signs. Keep active and maintain good exercise habits.

Risk factors and recommendations

- Lower limb muscle weakness: Reduced muscle strength can affect knee stability. Progressive strength training can help build muscle mass.
- Diabetes history: Diabetes is associated with higher knee OA risk. Maintain good blood glucose control and regular exercise.
- Knee flexion contracture: Difficulty fully straightening the knee may affect walking. Stretching and rehabilitation are recommended.
- Overweight: Excess weight adds load to the knee and may accelerate degeneration. Weight management may reduce knee stress.
- Smoking: Smoking may affect joint tissue repair. Reducing smoking may help reduce knee risk.
